# **Database Management System**

# **Project Review 2**

# **Title - VIT Clubhouse Web Portal**

## **Group Members:**

Karan Singh 19BCE2310 Kachireddy Raghavendra Kaushik 19BCE2320 Rishabh Vasudevan 19BCE2290

### Slot:

L11 + L12

## **Faculty Name:**

Prof. Kathiravan S.

### **Normalization**

Database normalization is the process of structuring a relational database in accordance with a series of so-called normal forms in order to reduce data redundancy and improve data integrity. It was first proposed by Edgar F. Codd as part of his relational model.

If a database design is not perfect, it may contain anomalies, which are like a bad dream for any database administrator. Managing a database with anomalies is next to impossible.

- Updation anomalies If data items are scattered and are not linked to each
  other properly, then it could lead to strange situations. For example, when we try
  to update one data item having its copies scattered over several places, a few
  instances get updated properly while a few others are left with old values. Such
  instances leave the database in an inconsistent state.
- **Deletion anomalies** We tried to delete a record, but parts of it was left undeleted because of unawareness, the data is also saved somewhere else.
- **Insertion anomalies** We tried to insert data in a record that does not exist at all.

Normalization is a method to remove all these anomalies and bring the database to a consistent state.

### → 1st Normal Form (1NF) -

For a table to be in the First Normal Form, it should follow the following 4 rules:

- 1. It should only have single(atomic) valued attributes/columns.
- 2. Values stored in a column should be of the same domain.
- 3. All the columns in a table should have unique names.

### → 2nd Normal Form (2NF) -

For a table to be in the Second Normal Form,

- 1. It should be in the First Normal form.
- 2. And, it should not have Partial Dependency.

### → 3rd Normal Form (3NF) -

A table is said to be in the Third Normal Form when,

- 1. It is in the Second Normal form.
- 2. And, it doesn't have Transitive Dependency.

### → Boyce-Codd Normal Form (BCNF) -

Boyce and Codd Normal Form is a higher version of the Third Normal form. This form deals with a certain type of anomaly that is not handled by 3NF. A 3NF table which does not have multiple overlapping candidate keys is said to be in BCNF. For a table to be in BCNF, following conditions must be satisfied:

- R must be in 3rd Normal Form
- and, for each functional dependency ( $X \rightarrow Y$ ), X should be a super Key.

## **Implementation of Normal Forms**

#### 1. User Account Table -

User\_Account(<u>email</u>, username, password, name, date\_joined, time\_table, last\_login, is\_active)

#### **Functional Dependencies -**

User Account

email □ username, name, password

email □ date\_joined

email, username □ timetable

last\_login □ is\_active

email □ last\_login

Candidate Key - "email"

### **Checking for various Normal Forms -**

• 1st Normal Form (1NF) -

All the attributes are single valued (atomic). This table is already in the First Normal Form as it satisfies all the conditions discussed above.

• 2<sup>nd</sup> Normal Form (2NF) -

Since the Functional Dependencies have no Partial Dependency and it is in 1st Normal Form, this table is already in Second Normal Form.

• 3<sup>rd</sup> Normal Form (3NF) -

The table fails the Third Normal Form because in the Function Dependency "last\_login □ is\_active" LHS is not a superkey and RHS contains a non-key attribute.

Converting this table to 3NF -

Splitting the table into two:

1. Attributes - (email, name, password, date\_joined, username, last\_login, timetable)

Functional Dependencies:

email □ last\_login, date\_joined

email □ name, username, password, timetable

2. Attributes - (last\_login, is\_active)

Functional Dependencies:

last\_login □ is\_active

### Boyce-Codd Normal Form (BCNF) -

A table is in BCNF if and only if for every non-trivial Functional Dependency, the LHS is a superkey. The FD "last\_login 
is\_active" is non-trivial and its LHS is not a superkey hence it violates BCNF.

Converting this table to BCNF -

Splitting this table into two:

1. Attributes - (email, name, password, date\_joined, username, last login, timetable)

Functional Dependencies:

```
email □ last_login, date_joined email □ name, username, password, timetable
```

2. Attributes - (last\_login, is\_active)

Functional Dependencies:

last login □ is active

#### 2. Resources -

Resources(<u>sub\_ID</u>, notes, previous\_cat\_papers, projects, DAs)

### **Functional Dependencies -**

Resources

```
sub_ID □ notes, projects
sub_ID □ previous_cat_papers
sub_ID □ DAs
```

Candidate Key - "sub\_ID"

### **Checking for various Normal Forms -**

• 1st Normal Form (1NF) -

All the attributes are single valued (atomic). This table is already in the First Normal Form as it satisfies all the conditions discussed above.

• 2<sup>nd</sup> Normal Form (2NF) -

Since the Functional Dependencies have no Partial Dependency and it is in 1st Normal Form, this table is already in Second Normal Form.

### • 3<sup>rd</sup> Normal Form (3NF) -

For each Functional Dependency, LHS is a super key or the RHS has only key attributes. Hence this table is in the Third Normal Form.

### Boyce-Codd Normal Form (BCNF) -

Since all the Functional Dependencies have super keys in the LHS therefore this table is already in Boyce-Codd Normal Form.

#### 3. Clubs -

Clubs(club name, club email, club website, social handles)

#### **Functional Dependencies -**

Clubs

```
club_name, club_email □ club_website club_email -□ social_handles
```

Candidate Key - "club name, club email"

### **Checking for various Normal Forms -**

• 1<sup>st</sup> Normal Form (1NF) -

Since "**social handle**" is a multivalued attribute hence this is not in the First normal form.

Converting this table to First Normal Form -

Splitting attribute "social handle":

Functional Dependencies:

```
club_name, club_email □ club_website
club_email □ social_handle1, social_handle2
```

• 2<sup>nd</sup> Normal Form (2NF) -

The functional dependency "club\_email □ social\_handle1, social\_handle2" violates definition of 2NF as LHS is a proper subset of Candidate Key.

Converting to 2NF -Splitting the table in two 1. Attributes - (club email, social handle1, social handle2) Functional Dependencies: 2. Attributes - (club\_name, club\_email, club\_website) Functional Dependencies: club email, club name □ club website • 3<sup>rd</sup> Normal Form (3NF) -The above Functional Dependency violates definition of 3NF: it is non-trivial, LHS is not superkey, RHS contains a non-key attribute. Converting to 3NF -Splitting the table in two 1. Attributes - (club\_email, social\_handle1, social\_handle2) Functional Dependencies: 2. Attributes - (club\_name, club\_email, club\_website) Functional Dependencies: club email, club name □ club website Boyce-Codd Normal Form (BCNF) -The FD club email, club name 

club website is non-trivial and its LHS is not a superkey. Therefore it violates BCNF Converting to 2NF -Splitting the table in two 1. Attributes - (club email, social handle1, social handle2) Functional Dependencies:

club\_email □ social\_handle1, social\_handle2

2. Attributes - (club\_name, club\_email, club\_website)

Functional Dependencies:

club\_email, club\_name □ club\_website

#### 4. Events -

Events(<u>Event\_name</u>, description, poster, date\_of\_event, club\_name)

#### Functional Dependencies -

**Events** 

Event name □ description, poster

Event name □ date of event

Event\_name □ club\_name

Candidate Key - "Event name"

### **Checking for various Normal Forms -**

### • 1st Normal Form (1NF) -

All the attributes are single valued (atomic). This table is already in the First Normal Form as it satisfies all the conditions discussed above.

### • 2<sup>nd</sup> Normal Form (2NF) -

Since the Functional Dependencies have no Partial Dependency and it is in 1st Normal Form, this table is already in Second Normal Form.

### • 3<sup>rd</sup> Normal Form (3NF) -

For each Functional Dependency, LHS is a super key or the RHS has only key attributes. Hence this table is in the Third Normal Form.

### Boyce-Codd Normal Form (BCNF) -

Since all the Functional Dependencies have super keys in the LHS therefore this table is already in Boyce-Codd Normal Form.

#### 5. Recruitments -

Recruitments(<u>recruitment ID</u>, club name, date, time, venue)

#### **Functional Dependencies -**

Recruitments

recruitment\_ID □ date, time, venue recruitment ID □ club name

Candidate Key - "recruitment ID"

### **Checking for various Normal Forms -**

### • 1<sup>st</sup> Normal Form (1NF) -

All the attributes are single valued (atomic). This table is already in the First Normal Form as it satisfies all the conditions discussed above.

### • 2<sup>nd</sup> Normal Form (2NF) -

Since the Functional Dependencies have no Partial Dependency and it is in 1st Normal Form, this table is already in Second Normal Form.

### • 3<sup>rd</sup> Normal Form (3NF) -

For each Functional Dependency, LHS is a super key or the RHS has only key attributes. Hence this table is in the Third Normal Form.

### Boyce-Codd Normal Form (BCNF) -

Since all the Functional Dependencies have super keys in the LHS therefore this table is already in Boyce-Codd Normal Form.

#### 6. Chat Rooms -

Chatrooms(<u>room\_name</u>, date\_created, ip\_address)

#### **Functional Dependencies -**

**Chat Rooms** 

room name □ date created, ip address

### Candidate Key - "room\_name"

### **Checking for various Normal Forms -**

### • 1st Normal Form (1NF) -

All the attributes are single valued (atomic). This table is already in the First Normal Form as it satisfies all the conditions discussed above.

### • 2<sup>nd</sup> Normal Form (2NF) -

Since the Functional Dependencies have no Partial Dependency and it is in 1st Normal Form, this table is already in Second Normal Form.

### • 3<sup>rd</sup> Normal Form (3NF) -

For each Functional Dependency, LHS is a super key or the RHS has only key attributes. Hence this table is in the Third Normal Form.

### • Boyce-Codd Normal Form (BCNF) -

Since all the Functional Dependencies have super keys in the LHS therefore this table is already in Boyce-Codd Normal Form.

### 7. Messages -

```
Messages(room_name, message, time_stamp, sender_ip)
```

#### **Functional Dependencies -**

Messages

```
room_name □ message
message □ time_stamp
message □ sender_ip
```

Candidate Key - "room\_name"

### **Checking for various Normal Forms -**

### • 1st Normal Form (1NF) -

All the attributes are single valued (atomic). This table is already in the First Normal Form as it satisfies all the conditions discussed above.

### • 2<sup>nd</sup> Normal Form (2NF) -

Since the Functional Dependencies have no Partial Dependency and it is in 1st Normal Form, this table is already in Second Normal Form.

### • 3<sup>rd</sup> Normal Form (3NF) -

The table fails the Third Normal Form because in the Function Dependency "message \( \text{time\_stamp} \) LHS is not a superkey and RHS contains a non-key attribute.

Converting this table to 3NF -

Splitting the table into two:

1. Attributes - (message, sender\_ip, time\_stamp)

**Functional Dependencies:** 

message □ sender\_ip, time\_stamp

2. Attributes - (room\_name, message)

Functional Dependencies:

room\_name □ message

### Boyce-Codd Normal Form (BCNF) -

A table is in BCNF if and only if for every non-trivial Functional Dependency, the LHS is a superkey. The FD "message 
time\_stamp" is non-trivial and its LHS is not a superkey hence it violates BCNF.

Converting this table to 3NF -

Splitting the table into two:

1. Attributes - (message, sender\_ip, time\_stamp)

**Functional Dependencies:** 

message □ sender\_ip, time\_stamp

#### 2. Attributes - (room\_name, message)

**Functional Dependencies:** 

room name □ message

### 8. Site Manager -

Site Manager(manager id, email)

**Functional Dependencies -**

Site Manager

manager id □ email

Candidate Key - "manager\_id"

### **Checking for various Normal Forms -**

1<sup>st</sup> Normal Form (1NF) -

All the attributes are single valued (atomic). This table is already in the First Normal Form as it satisfies all the conditions discussed above.

• 2<sup>nd</sup> Normal Form (2NF) -

Since the Functional Dependencies have no Partial Dependency and it is in 1st Normal Form, this table is already in Second Normal Form.

• 3<sup>rd</sup> Normal Form (3NF) -

For each Functional Dependency, LHS is a super key or the RHS has only key attributes. Hence this table is in the Third Normal Form.

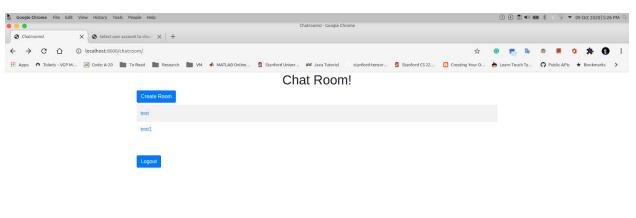

Boyce-Codd Normal Form (BCNF) -

Since all the Functional Dependencies have super keys in the LHS therefore this table is already in Boyce-Codd Normal Form.

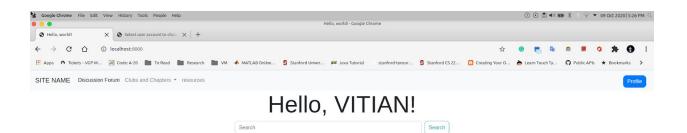

### **Software Used**

For implementing this Web Portal we will be using the Django Web Framework as our Backend and we will be making our database in PostgreSQL. Our frontend has been written in multiple languages which include - HTML5, CSS3, Javascript and Jquery.

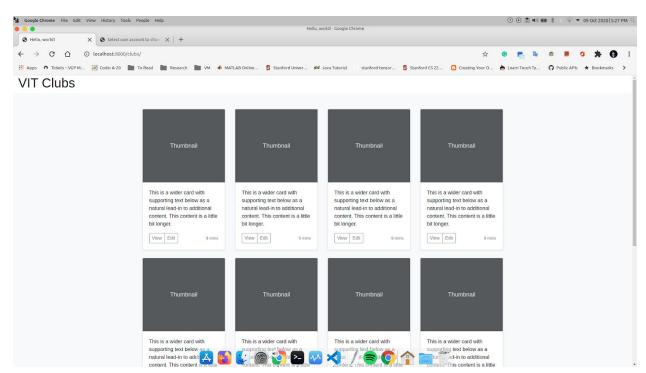

Screenshots of our partial implementation -

```
